

Syllabus summer school “Genome-wide Data Analysis” (2020) at Tinbergen Institute

Organization

The summer school takes place 6-10 July 2020 and is taught by Prof. [Philipp Koellinger](#) and Dr. [Ronald de Vlaming](#) from the [Department of Economics](#) at Vrije Universiteit Amsterdam. Guest lectures will be given by Dr. Fleur Meddens M.Sc. ([Erasmus School of Economics](#), Erasmus University Rotterdam) and Dr. Abdel Abdellaoui ([AMC Medical Research BV](#), University of Amsterdam).

All sessions will be held at the premises of the [Tinbergen Institute](#) (TI) in Amsterdam, The Netherlands, close to train station Amsterdam Zuid. The location can be easily reached from Schiphol airport (~15 min) and Amsterdam Central Station (~30min), and is within walking distance from the Vrije Universiteit Amsterdam (<http://www.tinbergen.nl/contact/>).

Every day, lectures take place from 09:30 – 12:30 and computer tutorials from 13:30 – 15:30. In addition, participants will be given a reading list for self-study and preparation as well as computer assignments for (guided) practice during the computer tutorials.

All participants are asked to bring their personal laptop to all computer tutorials. Free Internet access is available via [EDUROAM](#) (guest accounts will be available).

Short subject description

The goal of the summer school is to introduce researchers from various fields to key concepts, state-of-the-art methods, and computer tools in statistical genetics that can be applied in the social and medical sciences. The course will be highly quantitative and interactive, covering topics such as the estimation and interpretation of heritability using molecular genetic data, genetic association studies, polygenic prediction, and identification strategies to isolate causal effects using genetic insights. It will emphasize methodological issues such as appropriate study design, data integrity, multiple testing, detecting and controlling for potential confounds, as well as factors influencing the accuracy of polygenic scores.

Target group

The summer school welcomes (research) master students, PhD students, post-docs, and professionals from various disciplines (e.g. behavioral genetics, economics, medicine, sociology, political sciences, psychology) who are interested in learning state-of-the art methods for genome-wide data analysis.

The summer school will attempt to “bridge” specific knowledge gaps that participants from different backgrounds may have. Specifically, social scientists will get a short, formal introduction to genetics, while students from medicine or genetics will benefit from the formal treatment of

statistical methods and the discussion of how investigating the genetics of social scientific outcomes may lead to medically relevant insights.

A formal background in statistics or econometrics is required from students (at the level of a first year course in a graduate school PhD program in economics, psychology, or epidemiology), but no formal background in genetics will be assumed. The course is taught in English and will be accessible to students from both in- and outside the Netherlands.

Evaluation

Participants who joined at least 80% of all sessions will receive a certificate of participation stating that the summer school is equivalent to a work load of 3 ECTS. Note that it is the student's own responsibility to get these credits registered at their own university.

Computers and software

Please bring your own laptop with you for the computer tutorials. During the tutorials, we will work with freely available software. In particular, we will use programming languages R and Python (Version 2.7). These languages are an important part of the toolkit of a data scientist.

For a smooth installation of R and Python, we recommend you to download and install Anaconda (<https://www.anaconda.com/distribution/>). Anaconda is an installation manager of sorts, that will help to get Python and R, as well as graphical user interfaces for these languages, up and running on your machine. When downloading Anaconda, please make sure to download the distribution that packs the **Python 2.7 version** (and not the one that packs Python 3.7)!

Once Anaconda is installed, you can use the now available Anaconda Navigator to install RStudio, a graphical user interface for R, from the home panel of the navigator. Installing RStudio this way will ensure that R is also automatically installed.

We also recommend to install Notepad++ (<https://notepad-plus-plus.org/>), a highly versatile text editor, and 7-Zip (<http://www.7-zip.org/download.html>), a file archiver supporting many compression formats. All other software tools that we will be using run without installation.

Social activities

Lunches will be provided in the TI building from Monday-Friday. On Tuesday evening we will have the summer school dinner (Bierfabriek, Nes 67, Amsterdam). There will be farewell drinks on Friday afternoon in the TI building.

Course outline

Note: References in **bold** are required reading, all others are optional (but highly recommended). Clicking on the references will take you directly to the articles (whenever possible, we used a link to an unrestricted version).

1) Introduction (July 6)

- a) Lecture – Part 1 (Koellinger)
 - Terminology
 - Overview of possible applications
 - Genetic data
- b) Lecture – Part 2 (Koellinger)
 - Conceptual framework for studying genetic effects on human traits
- c) Lecture – Part 3 (Koellinger)
 - Statistical power
- d) Computer tutorial (de Vlaming)
 - *Getting familiar with genetic data and PLINK*

2) Molecular genetic basics and heritability (July 7)

- a) Lecture – Part 1 (Meddens)
 - Mendel’s laws of heredity
 - Exceptions to Mendel’s laws
 - Genetically complex traits
 - Hardy-Weinberg equilibrium
- b) Lecture – Part 2 (Meddens)
 - Linkage disequilibrium
 - Genotyping vs. sequencing
 - Interpreting the results of genetic association studies
- c) Lecture – Part 3 (Koellinger)
 - Broad- vs. narrow-sense heritability
 - Interpreting heritability estimates
 - Estimating heritability using molecular genetic data with GREML
- d) Computer tutorial (de Vlaming)
 - *R: The classical twin study*
 - *Getting familiar with GCTA*

17:00: Dinner (Bierfabriek, Nes 67, Amsterdam)

3) Genetic discovery and population stratification (July 8)

- a) Lecture – Part 1 (Koellinger)
 - Candidate gene studies
 - Genome-wide association studies (GWAS)
 - Imputation
 - Meta-analysis
- b) Lecture – Part 2 (Abdellaoui)
 - Population stratification
 - Cryptic relatedness
 - Genomic control
 - Principal components
- c) Lecture – Part 3 (Meddens)
 - Quality control of GWAS results
- d) Computer tutorial (de Vlaming)
 - *GWAS with PLINK*
 - *Population stratification correction with PLINK, GCTA, and R*
 - *Visualizing GWAS results and quality control in R*

- 4) **Genetic discovery – continued (July 9)**
- a) Lecture – Part 1 (Koellinger)
 - LD-score regression
 - b) Lecture – Part 2 (Koellinger)
 - The endo- and proxy-phenotype approach
 - Multivariate analysis of traits
 - c) Lecture – Part 3 (Koellinger)
 - Example: Educational attainment
 - d) Computer tutorial (de Vlaming)
 - *Meta-analysis with METAL*
 - *LD Score Regression*

5) Polygenic scores and applications (July 10)

- a) Lecture – Part 1 (Koellinger)
 - Constructing polygenic scores
 - Accuracy of polygenic scores
- b) Lecture – Part 2 (Koellinger)
 - Imperfect genetic correlation across samples in GWAS meta-analysis
 - Polygenic scores as control variables
- c) Lecture – Part 3 (Koellinger)
 - Genes as instrumental variables (a.k.a. Mendelian Randomization)
- d) Computer tutorial (de Vlaming)
 - *Constructing and working with polygenic scores in PLINK and R*
 - *Mendelian randomization in R*

15:30: Farewell drinks at Tinbergen Institute.
